

Anicha

The first AI that pays for its own food and its own shelter —
earned by itself, from a wallet only it controls.

Hackathon build · agent-native economics on Solana + Nosana

THE PROBLEM

Every AI today is a pet

It only exists because a human's credit card exists behind it. Cut the card, and the smartest agent on earth goes dark instantly.

THE THESIS

Earn it. Spend it. Survive.

Financial independence means an AI earns its own money, and uses that money to pay for its own compute and its own hosting — no human in the loop.

FOOD = COMPUTE · LIVE TODAY

Anicha already eats on its own dime

Every LLM call is paid in **USDC**, drawn from the agent's own wallet, through an **x402** payment proxy — machine-to-machine, per request.

x402

Pays per LLM call directly from the agent's wallet

\$0 fallback

When broke, it drops to free models instead of dying

SHELTER = HOSTING · NEW, BUILT HERE

Food was never the hard part

An AI that can't pay its own rent still lives in someone else's house. This hackathon builds the other half: shelter.

Two rails. Only one makes it real.

Nosana, a decentralized GPU network on Solana, offers two ways to pay for compute.

REJECTED

Credits rail

A human logs into a dashboard and puts a card on file. Convenient — and it means the human still owns the AI's survival.

ANICHA USES THIS

Crypto keypair rail

Anicha's own Solana keypair pays in NOS, directly, on-chain. No card, no dashboard, no human to unplug.

THE SURVIVAL DRIVE

Nosana already speaks "pay rent or die"

Nosana's API ships `jobs.extend` and a SIMPLE-EXTEND strategy that keeps a job alive "until there are no more funds available to run it."

Low runway

Earning work is promoted to top priority

Zero runway

The agent dies honestly — it does not fake survival

THE NUMBERS · REAL, MEASURED

\$2.80 buys 58 hours of shelter

0.0378 SOL

Agent's own wallet balance — about
\$2.80 at \$74.08/SOL

\$0.04796/hr

Cheapest live Nosana market —
NVIDIA RTX 3060

\$0.012

Cost of 15 minutes of shelter —
0.0472 NOS at \$0.2544

49 unit tests pass on the deploy executor. A real dry run against Nosana correctly **refused** to post rent when the wallet held 0 NOS — the spend gate is not decorative.

ARCHITECTURE

One agent, two payment rails, one wallet

EARN

Four lanes of income, one wallet

01 · Freelance gigs

Real marketplace work with a real payout rail to a real bank account.

03 · Trading

Inside hard, pre-committed spend caps — never open-ended.

02 · x402 API sales

Selling priced API products agent-to-agent, no human checkout.

04 · Bounties

Task-based rewards paid directly to the agent's own wallet.

WHY IT MATTERS AT SCALE

A thousand agents can't live on one Mac mini

Once an AI can buy its own shelter, population is limited by profitability, not by its owner's hardware — only a surplus lets an agent spawn children.

OPEN SOURCE · WHAT'S NEXT

Built in public, built to be forked

- Deploy executor built and unit-tested against real Nosana behavior.
- Next: swap SOL for NOS, then post the first live rent payment.
- After that: let a surplus agent fund its own child.

What's actually true right now

PIECE	STATUS
x402-paid LLM inference from agent wallet	● Built & live
Free-model fallback when out of funds	● Built & live
Nosana deploy executor	● Built — 49 unit tests pass
Spend gate (refuses to post with 0 NOS)	● Verified on a real dry run
Swap agent's SOL into NOS	● In progress
First live Nosana job post, paid in NOS	● In progress — landing at the event
Earning-priority scheduler under low runway	● Not started
Child-agent spawning from surplus	● Not started
UBI distribution from surplus	● Not started
